

Covid-19 and ethnic minorities: Brief extracts from Government Covid report on BAME

The government's report falls seriously short on commitment

Demands to address the health inequalities facing ethnic minorities date back at least two decades. Yet it has taken a global pandemic for those demands to be taken seriously. The question now is what can be done and how quickly?

Public Health England's (PHE) initial review on disparities in covid-19 was expected to tackle ethnic inequalities head on; instead the review dedicated just one short section to these concerns. The review's brief findings on ethnic disparities were stark but consistent with other research, and did not list further actions.

The government is believed to have delayed publication of the initial review and suppressed the release of PHE's full report on ethnic minorities. Kemi Badenoch, England's minister for equalities first told parliament that PHE could not make recommendations. Following a public outcry, the government has now released the full report, which includes a stakeholder consultation, a rapid review, and a brief set of recommendations. Given the current intensity of concern over the differential impacts of covid-19, it was insensitive and illogical to delay a report that is largely uncontroversial and limited in its recommendations, albeit broad in its scope.

PHE approached over 4000 external stakeholders, many of whom are seldom heard. Their opinions largely mirror the findings of the rapid review but provide invaluable context and insights into the possible causes of covid-19 disparities.

The report is clear that there is a problem. **Deaths from covid-19 among people from ethnic minorities are two to four times higher** than in the white majority population. The rapid review and the stakeholder consultation suggest that these differences may be partly explained by appearance of multiple illnesses, overcrowded housing, income inequality, and occupational risk although no original or secondary data are presented to provide a definitive answer.

Racism and distrust, says the report, result in limiting access to healthcare. Differential survival by ethnic group, with Bangladeshi men most at risk, is consistent with the established literature on the contribution of appearance of multiple illnesses such as diabetes and on the influence of delayed access to healthcare. The themes of delayed access and the role of racism emerge strongly from stakeholder interviews.

PHE's resulting recommendations are sensible and largely uncontroversial but they are not new and fail to direct a clear programme of action. The proposals lack detail and provide no time frames for delivery or methods of implementation. Crucially, nobody is held responsible or accountable. The report does not say which systems and structures will enable the actions to be delivered. Successful implementation of necessary measures to improve outcomes for ethnic minorities during this pandemic is a distant and receding prospect.

Public Health England's core recommendations

- Mandate ethnicity data collection and recording
- Support community participatory research
- Improve healthcare access, experience, and outcome
- Accelerate culturally tailored occupational risk assessment
- Fund and implement culturally tailored covid-19 messaging
- Accelerate culturally tailored chronic disease efforts
- Ensure covid-19 recovery reduces inequality caused by wider health determinants

PHE and others previously identified that wider socioeconomic inequalities and deprivation underpin ethnic disparities in covid-19 outcomes. Inequalities were exacerbated in recent years by changes to the labour market, social security system, and immigration policy. Low quality or insecure work appears to increase exposure and risks from covid-19. It is therefore disappointing to see only one recommendation on these deeply rooted wider determinants of health.

The recommendations are silent on the critical issues of employment security, adequate safety nets, and the causes of occupational segregation. Similarly, nothing is said about a longstanding need to reduce household overcrowding, a key candidate for covid-19 transmission.

Social housing restrictions on local authorities impair adequate housing provision for larger and multigenerational households. Interaction between immigration policy and the health risks for ethnic minorities, whether through avoiding seeking care or being unable to take leave from work is another area that requires sharper focus.
